Mathematics transition units © Crown Copyright 2003
Introduction to the transition units

The move from Year 6 to Year 7 can be daunting for pupils. After a long summer break, they are working in a new environment. They may have few friends, as their peers come from many different schools. They have to get to know new teachers and a different organisation. Teaching approaches may not be the same.

Your school will already have some effective arrangements to help pupils to make a successful start at secondary school. For example, there may be a local project, such as use of QCA or other bridging units. If this is the case, you may prefer to continue using these materials rather than introduce the transition units.

There are two pairs of transition units, one for mathematics and one for literacy/English:

- **Calculation and problem solving**: one unit involving five lessons at the end of Year 6 and a second unit of five lessons at the beginning of Year 7
- **Authors and texts**: one unit involving ten lessons at the end of Year 6 and a second unit of six lessons at the beginning of Year 7.

These units use teaching objectives drawn from the primary and Key Stage 3 Frameworks for teaching literacy/English or mathematics. If you are using the National Literacy Strategy's Year 6 Planning Guidance, or the National Numeracy Strategy’s Year 6 Unit Plans, the Year 6 transition units will already form part of your work for the summer term. The Key Stage 3 Frameworks help to provide continuity in teaching approaches and progression in what is taught in mathematics and English.

The Common Transfer Form provides information about pupils' attainment in end of key stage assessments. Nevertheless, it is often difficult for Year 7 teachers to gauge the curricular strengths and weaknesses of pupils who are new to their schools. The transition unit is another means of providing secondary teachers with some common information about pupils from different primary schools. Each Year 6 unit sets out to provide useful information about pupils' attainment in a manageable form by passing on information on pupils' strengths and weaknesses in certain aspects of the curriculum. The assessments and targets arising from the units can also be used to inform the teaching programmes developed for local literacy and numeracy summer schools.

The transition units are intended to ensure that:

- pupils experience a lesson structure they are familiar with and understand
- there is a consistency in teaching approach that will help pupils to respond to new people in new surroundings
- pupils are able to build on their early successes and demonstrate what they know, understand and can do in the context of the work they did in Year 6
- teachers are better informed about pupils’ strengths and weaknesses and can use the lessons to confirm their assessments and plan teaching programmes that meet the needs of their pupils
- there is greater continuity and progression and less repetition of work.
For the transition units to succeed, primary schools need to make sure that pupils' work from the Year 6 units is transferred to the appropriate secondary school. When it is not clear to which secondary school pupils will transfer, the pupils may keep their work themselves, to take it to their new schools.

This is the first year that the transition units have been used. The Strategy teams would welcome feedback via the LEA's literacy/English and numeracy/mathematics consultants on the extent to which the units have supported transition arrangements, and ways in which the units could be developed further.

**The mathematics transition units**

The Year 6 transition unit is one of the summer term units from the Unit Plans being developed by the National Numeracy Strategy. The unit, *Calculation and problem solving*, like all six units in the second half of the summer term, focuses on three of the Year 6 key objectives identified in the *Framework for teaching mathematics from Reception to Year 6*. There is a strong emphasis on pupils solving problems and developing their mathematical reasoning skills.

The material in the Year 6 unit is developed in the Year 7 mathematics unit. These transition units are designed to provide pupils with a continuity and familiarity in content and approach, while maintaining the momentum of pupils' progress from Year 6 to Year 7. The units set out to teach pupils the knowledge, skills and understanding in key areas of learning that teachers can build upon in later lessons. The lessons are intended to do this in an interesting way that will motivate pupils and help them to recognise what they are achieving.

Included within the Year 6 transition unit are two self-assessment sheets for pupils to complete. Time for pupils to undertake short tasks to help them with their self-assessment is built into the plenary sessions. The assessments are based on the key objectives in the unit. Pupils are also invited to set themselves a target for the next stage in their mathematics learning. The self-assessment sheets and targets are to be attached to the pupils' work. This information can be used by Year 7 teachers to help pupils to recognise their progress, and by teachers preparing summer numeracy school programmes to help these pupils to meet their targets before they start at secondary school.

Schools using the Year 6 Unit Plans will be able to add this assessment information to what they are already gathering over the term. This will give a summary of their pupils' performance against the key objectives for Year 6 and provide secondary teachers with a valuable profile of achievement to direct their teaching in Year 7.

The structure of the lesson plans in the Year 6 mathematics transition unit will be familiar to most teachers. Each lesson refers to the objectives in the Framework and follows a three-part structure. The oral and mental starter is often linked to the work in the main teaching in the lesson, where associated problems are set and developed. The lessons include key questions that direct pupils' attention to the important areas for learning; these also provide teachers with some informal assessment information to direct the next steps in their teaching. The plenary sessions draw together pupils' ideas and often introduce an extension to the task that requires pupils to apply what they have learned in the lesson. The later plenary sessions give a strong focus to assessment to help pupils to recognise what they can do and what they might continue to strive to achieve.
A key feature of the Year 6 transition unit is its drawing together of earlier teaching and learning. The emphasis is on enabling pupils to use and apply what they have already learned to solve problems, to test a hypothesis and present an argument to justify their decisions. As pupils come to the end of Key Stage 2 it is important that they can draw upon what they have learned, refreshing what they might have forgotten by applying it in different and interesting contexts. The unit aims to keep pupils engaged and motivated in mathematics, ready to meet the challenges they are to encounter during their secondary education.

The Year 7 transition unit is based on the unit ‘Number 1’ in the Key Stage 3 Sample medium-term plans for mathematics, with some minor changes to follow on more appropriately from the Year 6 unit.

The Year 7 unit focuses on two of the distinctive features in number in Key Stage 3 (Guide to the Framework pp 10–13):

- building on the approach to calculation developed in Key Stage 2, which emphasises mental methods and gradually refined written methods, extending to calculations with fractions, decimals and percentages
- developing effective use of calculators, including choosing appropriate methods for estimating, calculating and checking.

The key objectives in the Year 6 transition unit aim to ensure pupils can:

- carry out short multiplication and division of numbers involving decimals
- carry out long multiplication of a three-digit by a two-digit integer
- identify and use the appropriate operations to solve word problems involving numbers and quantities, and explain methods and reasoning

These are extended by the objectives in Year 7, to:

- understand negative numbers as positions on a number line; order, add and subtract positive and negative integers in context
- multiply and divide three-digit by two-digit whole numbers; extend to multiplying and dividing decimals with one or two places by single-digit whole numbers
- solve word problems and investigate in the context of number; compare and evaluate solutions.

This Year 7 unit of work aims to support mathematics teachers in building upon the work pupils completed in Year 6, by providing opportunities to draw on pupils’ shared mathematical experiences to establish a sense of continuity and cohesion, and by revising knowledge and skills developed in Key Stage 2 in order to extend attainment. The unit sets some of the work in a context similar to that of the Year 6 unit, for example, using sets of coins and solving puzzles where numbers are put into boxes, but it also extends the context to include negative integers.

Throughout the Year 7 unit pupils are encouraged to work collaboratively. This allows them and the teacher to begin to get to know each other in these early weeks of the term, recognising that in some areas secondary schools may have new pupils from several feeder schools. Using and applying mathematics and thinking skills are integrated within the teaching, with problems used to set a context for the work.
Year 6 transition unit: calculation and problem solving

Unit objectives
The objectives for this unit are:

- Carry out short multiplication and division of numbers involving decimals.
- Carry out long multiplication of a three-digit by a two-digit integer.
- Identify and use appropriate operations (including combinations of operations) to solve problems involving numbers and quantities, and explain methods and reasoning.
- Choose and use appropriate number operations to solve problems and appropriate ways of calculating: mental, mental with jottings, written methods, calculator.
- Factorise numbers into prime factors.
- Develop calculator skills and use a calculator effectively.

Differentiation
The teaching set out in the unit emphasises a whole-class, interactive, teaching approach. The intention is that all pupils are engaged in discussion and collaborative working and share a common experience. This is to provide pupils with work they can build on, as they engage with other pupils in their secondary school.

Those pupils who complete the work easily and quickly should be asked questions that will encourage them to extend the work and explore alternative approaches. For example, on day one the questions may require pupils to decide whether each of the two coins needs to represent an odd number of pence, whether both coins could represent even amounts and to explore why certain pairs of coins may be better choices than others. Pupils who find the work demanding may benefit from using practical resources to enable them to understand the processes involved and begin to see that the 3p and 5p coins can be used for payments of many different amounts of money.

Resources
Day 1: None, but coins made from card might help some pupils.

Day 2: OHT 1, OHP calculator, class set of calculators, Resource sheet 1, Self-assessment sheet 1

Day 3: OHT 1, Resource sheet 1, Self-assessment sheet 1

Day 4: OHT 2, OHT 3, OHP calculator, class set of calculators, Resource sheet 1, Self-assessment sheet 1

Key mathematical terms and notation

commutative, dimensions, exact, factor, index notation, measures of area, multiples, prime, prime factor, remainder
Year 6 transition unit: calculation and problem solving

Summer term

Unit objectives

- Carry out short multiplication and division of numbers involving decimals.
- Carry out long multiplication of a three-digit by a two-digit integer.
- Identify and use appropriate operations (including combinations of operations) to solve problems involving numbers and quantities, and explain methods and reasoning.
- Choose and use appropriate number operations to solve problems and appropriate ways of calculating: mental, mental with jottings, written methods, calculator.
- Factorise numbers into prime factors.
- Develop calculator skills and use a calculator effectively.

Five daily lessons

- Carry out short multiplication and division of numbers involving decimals.
- Carry out long multiplication of a three-digit by a two-digit integer.
- Identify and use appropriate operations (including combinations of operations) to solve problems involving numbers and quantities, and explain methods and reasoning.
- Choose and use appropriate number operations to solve problems and appropriate ways of calculating: mental, mental with jottings, written methods, calculator.
- Factorise numbers into prime factors.
- Develop calculator skills and use a calculator effectively.

Link objectives

- Use informal paper and pencil methods to support, record or explain multiplications and divisions.
- Extend written methods to: short multiplication of HTU or U.t by U; long multiplication of TU by TU; short division of HTU by U (with integer remainder).
- Use all four operations to solve simple word problems involving numbers and quantities and explain methods and reasoning.
- Choose and use appropriate number operations to solve problems and appropriate ways of calculating: mental, mental with jottings, written methods, calculator.
- Find all the pairs of factors of any number up to 100.
- Develop calculator skills and use a calculator effectively.

- Multiply and divide three-digit by two-digit whole numbers; extend to multiplying and dividing decimals with one or two places by single-digit whole numbers.
- Solve word problems and investigate in the context of number; compare and evaluate solutions.
- Enter numbers in a calculator and interpret the display in different contexts (decimals, money, metric measures).

Key objectives are in bold
### Day 1 Calculation and problem solving

#### Oral and mental

**Objectives, vocabulary and resources**

- **Objectives**
  - Recognise and extend number sequences
  - Recognise multiples up to 10 x 10

**Teaching activities**

- Write on the board: $\begin{array}{c} 3 \\ 5 \end{array}$
- Quickly rehearse the multiplication tables for 3 and 5 with the whole class.
- **Q: What numbers appear in the 3 and the 5 times tables?**
- Divide the class into two groups. Set one group to count in 3s, the other to count in 5s to generate the sequence:
  - 3, 5, 6, 9, 10, 12, 15, ...

- **Q: What numbers do not appear in the sequence? Why?**
- Establish that only multiples of 3 or 5 (or both) can be in the sequence.

**Vocabulary**

- Multiples

#### Main teaching

**Objectives, vocabulary and resources**

- **Objectives**
  - Identify and use appropriate operations (including combinations of operations) to solve problems involving numbers and quantities, and explain methods and reasoning

**Teaching activities**

- Tell the children that you want them to think about how they could pay for goods if they could only use 3p and 5p coins.
- **Q: How could you pay for a 2p sweet?**
  - Establish that you could give 5p and get 3p change.
  - Record as: $5p - 3p = 2p$
- **Q: What method of payment involves fewest coins changing hands?**
- Agree on:
  - $4 \times 5p + 3 \times 3p = 29p$
- **Q: Which of these amounts can you pay?**
  - Fill in the obvious amounts, such as 3p, 5p, 6p, 9p and 10p, and 2p from earlier.

#### Plenary

**Teaching activities and assessment**

- **Q: Can we pay for goods costing 10p, 20p, 100p, 200p ...?**
  - Establish that only 5p coins will be needed.
- **Q: How can we pay a bill of £4.67?**
  - Explain that £4.67 is equivalent to 400p + 60p + 7p.
  - Say that we can pay the 400p and 60p with just 5p coins.
- **Q: How could we pay the 7p?**
  - Return to the list on the board, to establish that the 7p could be paid by giving 10p (2 x 5p) and receiving a 3p coin in change.
  - Ask the children to think how they might convince someone that you can pay for goods of any price using only 3p and 5p coins.
  - Collect their reasons and explain that communicating and reasoning are important skills in mathematics.
- **Q: What other pairs of coins could the Government introduce? What about 7p and 10p?**

**Homework**

- Ask the children to decide whether 7p and 10p coins would work and to prepare a convincing argument for the next lesson.

**Assessment**

- Explain to the children that, during the week, they will be completing ‘My Mathematics’ self-assessment sheets that they will take to their secondary school.
### Day 2 Calculation and problem solving

#### Oral and mental

**Objectives, vocabulary and resources**

- Quickly rehearse the 7 times table. Present the children with the following problem.
- **Q:** Using only the numbers 7 and 10 and the operations + and −, can you make all the numbers from 1 to 10? Explain that they can use the numbers and operations more than once, for example the number 4 can be made as follows: 7 + 7 − 10 = 4
- Remind the children of the last lesson and ask how the problem is similar to the one in the homework they were set. Discuss children’s reasons and explanations, and make connections between their reasons and the above problem.
- Show OHT 1. Explain that they are going to work on a problem in which numbers will represent the letters of the alphabet. Say that every work is to have a value that is found by multiplying the values of the letters in the word, for example, ‘PLAN’ will have a value: 16 × 12 × 1 × 14 = 2688
- Demonstrate the on the OHP calculator. Let children use their calculators to check.

**Vocabulary**

- **Vocabulary commutative**
- **Resource OHT 1**
- **OHP Calculator**
- **Class set of calculators**

**Resources**

- **OHT 1**
- **Self-assessment sheet 1**
- **‘My Mathematics’**

---

#### Main teaching

**Objectives, vocabulary and resources**

- **Objectives**
  - Choose and use appropriate number operations to solve problems and appropriate ways of calculating
  - Develop calculator skills and use a calculator effectively
  - Factorise numbers

**Resources**

- **Resource sheet 1**
- **‘My Mathematics’ Self-assessment sheet 1**

**Teaching activities**

- Give out Resource sheet 1.
- **Q:** What is the value of the word MILLION?
  - With the class, establish that the answer is 31 842 720. Ask the children to say the number and note that this value is much more than a million.
  - Say that today they are going to try to find a word with a value of exactly 1 000 000. Refer to the above example and point out that the solution is not necessarily going to be a long word.
  - Let the children work in pairs to explore the values of different words. After a time, bring the children together and discuss some of the words they have found. On the board, record the five words with values closest to 1 000 000. Explain that sometimes it is useful to look at the problem another way. Write BAD, CAT and SIT in a list on the board and ask the children to find their values. Write their responses on the board, as shown.

| Word | Value | Factors of the word’s value (≤)
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD</td>
<td>2 × 2 = 4 = 6</td>
<td>1, 2, 4, 6</td>
</tr>
<tr>
<td>CAT</td>
<td>3 × 20 = 60</td>
<td>1, 2, 3, 4, 5, 6, 10, 12, 15, 20</td>
</tr>
<tr>
<td>SIT</td>
<td>19 × 10 = 320</td>
<td>1, 2, 3, 4, 5, 6, 9, 10, 12, 15, 18, 19, 20</td>
</tr>
</tbody>
</table>

- Establish why BAD has a small value compared with SIT.

**Q:** Which factors can you use to make a word with a value of 8?

- Establish that the only letters that can be used are A, B, D and H and that these represent the factors of 8. Record the factors of 8 in the third column, as shown.

**Q:** Which letters can you use to make a word with a value of 60?

- Establish that the letters that can be used are A, B, C, D, E, F, J, L, O and T and record their values in the third column of the table. Explain that these numbers are some of the factors of 60.

**Q:** Can you find any other factors of 60?

- Agree that the missing factors are 30 and 60.

**Q:** Why do you think any factor greater than 26 is not important?

- Establish that factors greater than 26 are not necessary as there are only 26 letters in the alphabet. Point out the heading in the third column ($\leq 26$).

**Q:** Which factors are we interested in?

- Explain that we are looking for the factors that are less than or equal to 26. Establish that these are 1, 2, 4, 5, 6, 8, 10, 12, 16, 18, 20 and 25 and that the associated letters are A, B, D, E, H, J, P, T and Y.

#### Plenary

**Teaching activities and assessment**

- Work with the class to begin to find the factors of 1 000 000. Remind the children that factors come in pairs. Let them use calculators, with the method below, to find the factors.

<table>
<thead>
<tr>
<th>1</th>
<th>2</th>
<th>4</th>
<th>6</th>
<th>8</th>
<th>10</th>
<th>15</th>
<th>16</th>
<th>20</th>
<th>30</th>
</tr>
</thead>
<tbody>
<tr>
<td>250 000</td>
<td>500 000</td>
<td>1 000 000</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- Stop after the first few factors.

**Q:** Which factors are we interested in?

- Explain that the only letters that can be used are A, B, D, E, H, J, P, T and Y. Let the children work in pairs to make up a ‘new’ word that ‘hits a million.’ Explain that it need not be a real word, it may be just a group of letters.

- With the class, collect some of their ‘new’ words and check that their value is 1 000 000.

**Q:** Can any word that has a value of 1 000 000 include C or K?

- Ensure that the children recognise that neither 3 (C) nor 11 (K) are factors of 1 000 000 and that the only letters that can ever be used to make a million are A, B, D, E, H, J, P, T and Y.

- Collect in the calculators.

**Assessment**

- Give out the ‘My Mathematics’ Self-assessment sheet 1. Explain that, during the rest of the week, the children will be asked to say how well they can do some of the mathematics they have been working on. Say that there will be some time at the end of each lesson to complete their sheet. Refer to the first multiplication on the sheet. Explain that they can choose to multiply 257 by 2, 3, 5, 8 or 9 and that the number they choose will depend on how confident they feel. Tell the children they should choose the number that they think shows well how they can multiply without using a calculator.

- When they have done the multiplication they should share their work with a friend. Some of the children may need help, from you or another child. When the child has completed the question they should then tick the box that records whether they required any help.

- Give the children a few minutes to work on the first multiplication question. Give out answers and discuss.
## Day 3 Calculation and problem solving

### Oral and mental

**Objectives, vocabulary and resources**
- Carry out short and long multiplication
- Recognise prime numbers to at least 20

**Resources**
- OHT 1 Resource sheet 1

**Teaching activities**
- Ask the children to work in pairs to find words made from the ‘prime letters’ B, C, E, G, K, M, Q, S and W. Say that each letter may be used more than once. Say that they are going to begin by finding only two-, three- and four-letter words. After a time collect children’s answers and note the value of each word, for example:
  - SEEM = 19 × 5 × 5 × 13 = 6175
  - MESS = 13 × 5 × 19 × 19 = 23 465
- Point to one of the answers (for example, SEEM = 19 × 5 × 5 × 13 = 6175). Say that all the numbers are factors of the word’s value and we know all the factors are prime numbers. Explain that the word’s value is represented as the product of its prime factors. Write for SEEM its value:
  - 6175 = 5 × 5 × 13 × 19
- Establish first that the letters must have values that are factors of 50 and these are 1, 2, 5, 10, 25, therefore the letters represented are A, B, E, J and Y. Write these letters on the board.
- Underline the prime numbers 2, 3 and 5. Cross out these letters.
- Agree it is 2 × 5 = 10.

**Vocabulary**
- prime factor

**Resources**
- ‘My Mathematics’ Self-assessment sheet 1

**Objectives**
- Choose and use appropriate number operations to solve problems and appropriate ways of calculating
- Carry out short division, and short and long multiplication
- Factorise numbers into prime factors

**Teaching activities**
- Ask the children to work in pairs to find words made from the ‘prime letters’ B, C, E, G, K, M, Q, S and W. Say that each letter may be used more than once. Say that they are going to begin by finding only two-, three- and four-letter words. After a time collect children’s answers and note the value of each word, for example:
  - SEEM = 19 × 5 × 5 × 13 = 6175
  - MESS = 13 × 5 × 19 × 19 = 23 465
- Point to one of the answers (for example, SEEM = 19 × 5 × 5 × 13 = 6175). Say that all the numbers are factors of the word’s value and we know all the factors are prime numbers. Explain that the word’s value is represented as the product of its prime factors. Write for SEEM its value:
  - 6175 = 5 × 5 × 13 × 19
- Establish first that the letters must have values that are factors of 50 and these are 1, 2, 5, 10, 25, therefore the letters represented are A, B, E, J and Y. Write these letters on the board.
- Underline the prime numbers 2, 3 and 5. Cross out these letters.
- Agree it is 2 × 5 = 10.

**Q:** What prime number will multiply this number up to 50?

- Establish that the prime is 5, represented by the letter E. Confirm that the value of the word BEE is 50 and is the product of the primes 2, 5 and 5.
- Let the children work in pairs to find the set of ‘prime letters’ to make the totals 230, 330, 2185 and 3575. They should use short division to find the factors, then try to make a word from the letters.
- Collect words and check answers.
- Explain that the activities they have been working on represent an important topic of mathematics. In trying to find words with particular values they have been trying to express a number as the product of its prime factors.
- Write on the board:
  - ‘Every whole number apart from 1 can be expressed as a product of primes – true or false?’
- Q: How can we express 90 as a product of primes?

- Establish that 90 = 2 × 3 × 3 × 5 = 2 × 3² × 5.
- Say that this is how 90 is expressed as a product of its primes.
- Confirm that it will always be possible to do this and the above statement is true.

**Q:** What other words can you make that just use letters with prime number values and the letter A?

- Let the children work in pairs to find words made from letters that have prime number values and the letter A and work out their values.
- Pick two of the children’s words, without revealing them to the class. Give the other children the values and ask them to identify the words.

**Q:** How can we use the numbers 2, 3 and 5 to make a multiplication statement equal to 90?

- Establish that 90 = 2 × 3 × 3 × 5 = 2 × 3² × 5.
- Say that this is how 90 is expressed as a product of its primes.
- Confirm that it will always be possible to do this and the above statement is true.

**Q:** If a ‘hit a million’ word could be made up only of Bs and Es, how many Bs and Es would there be in the word?

- Let the children work in pairs to find how many Bs and Es are required.
- Establish that six Bs and six Es would be needed. Write on the board:
  - 1 000 000 = 2 × 2 × 2 × 2 × 2 × 2 × 5 × 5 × 5 × 5 × 5 × 5 = 2⁶ × 5⁶

**Plenary**

**Teaching activities and assessment**
- Write the following list on the board.
  - 1, 2, 4, 5, 8, 10, 16, 20, 25
- Remind children that these are the factors of 1 000 000 that are less than 26.

- Q: Which of these numbers are prime?

- Establish that only 2 and 5 are prime and that the letters represented by these numbers are B and E.

- Q: A four-letter word contains the letters A and three other letters with values that are all prime numbers. The value of the letter is 66. What could the word be?

- Establish that the product of the three letters will be 66 and that the three prime numbers will be 2, 3 and 11. So the letters are B, C and K, but as A can always be used, the word is BACK.
- Ensure that the children can identify letters with values that are prime numbers.

- Q: What other words can you make that just use letters with prime number values and the letter A?

- Let the children work in pairs to find words made from letters that have prime number values and the letter A and work out their values.

- Pick two of the children’s words, without revealing them to the class. Give the other children the values and ask them to identify the words.

<td>Write on the board:</td>
<td>Present the following problem.</td>
<td>Q: Is there a way that we can calculate the total area of cake for each child by looking at the problem another way?</td>
</tr>
<tr>
<td>A: 168 ÷ 2</td>
<td>Jane has a square cake and wants to share it equally among three children. Jane likes squares and decides that all the pieces given to the three children will be square.</td>
<td>Establish that eventually there will be no cake left so all of the cake will have been shared among the three children.</td>
</tr>
<tr>
<td>B: 168 ÷ 6</td>
<td>Q: How could Jane give each of the three children a square piece of cake?</td>
<td>Ask the children to carry out the calculation 324 ÷ 3. Record the answer on OHT 3.</td>
</tr>
<tr>
<td>C: 168 ÷ 4</td>
<td>Discuss children’s suggestions and solutions.</td>
<td>Compare this answer of 108 cm² with the answer following the fourth and fifth cuts to confirm that after five cuts there is very little of the cake left to be shared. Collect in the calculators.</td>
</tr>
<tr>
<td>D: 168 ÷ 3</td>
<td>Q: How should Jane cut the cake so that each child gets the biggest square possible?</td>
<td><strong>Assessment</strong></td>
</tr>
<tr>
<td>E: 168 ÷ 5</td>
<td>Agree that cutting into four squares ensures that each child could receive the largest square piece and that there would be one square piece left over. Show OHT 2 and say that the area of the cake is 324 cm².</td>
<td>Ask the children to take out their ‘My Mathematics’ Self-assessment sheet 1 and to work on the third multiplication question (multiply 34.8 by 2, 4, 6, 7 or 9) and the division question (E3 ÷ 68 ÷ 2, 4, 6 or 8). Remind them that their choice of number should show how well they can perform each calculation. Give out answers and discuss.</td>
</tr>
<tr>
<td>F: 168 ÷ 10</td>
<td>Q: How can we work out the area of each piece of cake if they were given one of the squares?</td>
<td>Say, ‘Tomorrow we shall be looking at the 3p and the 5p problem.’ Remind the children about the work that they did on Day 1 and how they thought about their reasons for the answers they gave. Tell them that they will have the chance to look at the question tomorrow but they should refer back to their work on the problem for homework.</td>
</tr>
<tr>
<td>G: 168 ÷ 8</td>
<td>Establish that the required calculation is 324 ÷ 4. Ask the children to do the short division to confirm that the area of each piece is 20.25 cm².</td>
<td><strong>Resources</strong></td>
</tr>
<tr>
<td>H: 168 ÷ 9</td>
<td>Agree that the dimensions of the smaller squares are 4.5 cm by 4.5 cm and ask the children to carry out a multiplication to confirm that the area of each small square is 20.25 cm².</td>
<td>OHP calculator</td>
</tr>
<tr>
<td><strong>Resources</strong></td>
<td>Q: How much cake will each child have altogether now?</td>
<td><strong>Vocabulary</strong></td>
</tr>
<tr>
<td>OHT 2</td>
<td>Ask the children to add the area of the two squares. 81 + 20.25 = 101.25 cm²</td>
<td><strong>Dimensions</strong></td>
</tr>
<tr>
<td>OHT 3</td>
<td>Explain that Jane keeps dividing the remaining piece of cake into four smaller squares, and giving out three squares.</td>
<td>‘My Mathematics’ Self-assessment sheet 1</td>
</tr>
<tr>
<td>‘My Mathematics’ Self-assessment sheet 1</td>
<td>Show OHT 3. Explain that this table shows the calculations for the first and second cuts. Give out calculators. Ask the children to work out the calculation for the third cut, using a calculator. Collect answers and record on OHT 3. Repeat for the fourth and fifth cuts.</td>
<td><strong>Teaching activities</strong></td>
</tr>
<tr>
<td>Class set of calculators</td>
<td>Q: How many rows do you think there will be in this table?</td>
<td><strong>Teaching activities</strong></td>
</tr>
<tr>
<td></td>
<td>Discuss children’s responses and explore the idea of infinity and convergence.</td>

<td></td>
</tr>
<tr>
<td>Discuss the children’s answers and reasoning. $(513 \times 24)$</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Teaching activities and assessment</strong></td>
<td><strong>Assessment</strong></td>
<td>Give out ‘My Mathematics’ Self-assessment sheet 2. Allow time for the children to consider the question on the sheet. Work with individual children to discuss their reasons and explanations. Ask the children to say whether they needed help in deciding if Luke was right or wrong, and why. Discuss the solution to the problem, with the class. Explain that the table on the bottom half of the sheet is for the children to summarise how well they have been able to answer each question. Ask the children to look at the statements in the left-hand column. The questions alongside each statement are intended to remind the children what each statement means. Ask the children to look back on their work to help them fill in the table. Encourage the children to complete each statement by putting a tick in one box and to put a circle around the number they chose for their calculation. Ask the children to think about all the different calculations and reasoning strategies they have been working on. Ask them to complete the target statement by choosing an area that they think they need to improve. For those children who were able to answer all the questions without any help, discuss the learning objectives for Year 7 shown on the front page of the unit. Get the children to stick ‘My Mathematics’ Self-assessment sheets 1 and 2 in their books under their work.</td>

Year 6
My Mathematics
Self-assessment sheet 1

My calculation
Show or discuss with a friend.

I did this calculation:
on my own
with some help

Multiply 257 by 2, 3, 5, 8 or 9.

Multiply 456 by 12, 23, 54 or 67.

Multiply 34.8 by 2, 4, 6, 7 or 9.

Divide £31.68 by 2, 4, 6 or 8.
The money problem
The Government wants to issue only 2p and 6p coins. Luke says, "You can buy items of any price."
He explains:

10p = 2p + 2p + 6p
So you can buy items costing 10p, 20p, 30p, and so on, for ever.
You can also buy items costing 2p, 4p, 6p and so on, for ever, so you can pay for

Is Luke right or wrong?

I think Luke is right/wrong because:

I explained my reasons:
on my own
with some help

Show or discuss with a friend.

My next target:
I want to get better at ____________________________
Year 7 transition unit: calculation and problem solving

Unit objectives

The objectives for this unit are:

A Understand and use decimal notation and place value; multiply and divide integers and decimals by 10, 100, 1000, and explain the effect.

B Understand negative numbers as positions on a number line; order, add and subtract positive and negative integers in context.

C Consolidate the rapid recall of number facts, including positive integer complements to 100 and multiplication facts to $10 \times 10$, and quickly derive associated division facts.

D Use standard column procedures to add and subtract whole numbers and decimals with up to two places.

E Multiply and divide three-digit by two-digit whole numbers; extend to multiplying and dividing decimals with one or two places by single-digit whole numbers.

F Enter numbers in a calculator and interpret the display in different contexts (decimals, money, metric measures).

G Solve word problems and investigate in the context of number; compare and evaluate solutions.

These objectives build on key objectives in Year 6. It is important that pupils practise and extend their calculation strategies in Year 7 and become more efficient and proficient and that they are taught to select methods appropriate to the context. Calculator skills will have been introduced to pupils in Year 6; they are expected to use calculators effectively.

Pupils attaining at least level 4 in Key Stage 2 are expected to:

- extend written methods to:
  - column addition and subtraction of numbers involving decimals
  - short multiplication and division of numbers involving decimals
  - long multiplication of a three-digit by a two-digit integer

- identify and use the appropriate operations (including combinations of operations) to solve word problems involving numbers and quantities, and explain methods and reasoning.

Differentiation

The notes for the unit indicate possible support and extension ideas, referencing *Springboard 7* and the Framework’s supplement of examples which provides extension examples across Years 7, 8 and 9. Examples can be chosen as appropriate.
Resources

Lesson 1: Counting stick, number fans or mini-whiteboards, two large double-sided cards for demonstration (one card with the 7 on one side and –2 on the other and the other card with 5 on one side and –3 on the other), three or four smaller versions of these double-sided cards per pair of pupils

Lesson 2: Resource sheet 1 Number cards, three or four of the double-sided cards (as for lesson 1) per pair of pupils

Lesson 3: OHT 1 Target number grid, OHT 2 Equivalent products, Resource sheet 2 Calculations, Resource sheet 3 Errors in calculations

Lesson 4: OHP calculator, set of calculators (one per pair of pupils), Resource sheet 4 Problems in the millions!

Lesson 5: Resource sheet 5 Largest calculations, Resource sheet 6 Largest product

Key mathematical terms and notation

difference, explain, integer, minus, negative (e.g. –6), plus, positive (e.g. +6), reasoning, sum, systematic
Year 7 transition unit: calculation and problem solving

Autumn term

- Understand and use decimal notation and place value; multiply and divide integers and decimals by 10, 100, 1000, and explain the effect.
- Understand negative numbers as positions on a number line; order, add and subtract positive and negative numbers in context.
- Consolidate the rapid recall of number facts, including positive integer complements to 100 and multiplication facts to 10 \* 10, and quickly derive associated division facts.
- Use standard column methods to add and subtract whole numbers and decimals with up to two places.
- Multiply and divide three-digit by two-digit whole numbers; extend to multiplying and dividing decimals with one or two places by single digit whole numbers.
- Enter numbers in a calculator and interpret the display in different contexts (decimals, money, metric measures).
- Solve word problems and investigate in the context of number; compare and evaluate solutions.

Five daily lessons

- Add, subtract, multiply and divide integers.
- Multiply and divide integers and decimals such as 0.6 and 0.06; understand where to position the decimal point by considering equivalent calculations.
- Recall known facts, including fractions to decimal conversions; use known facts to derive unknown facts, including products such as 0.7 and 6, and 0.03 and 8.
- Give solutions to an appropriate degree of accuracy.

Key objectives are in bold

Link objectives

- Carry out short multiplication and division of numbers involving decimals.
- Carry out long multiplication of a three-digit by a two-digit number.
- Identify and use appropriate operations (including combinations of operations) to solve problems involving numbers and quantities, and explain methods and reasoning.
- Choose and use appropriate number operations to solve problems and appropriate ways of calculating.
- Develop calculator skills and use a calculator effectively.
## Lesson 1 Recap on Year 6 work

### Oral and mental

<table>
<thead>
<tr>
<th>Objectives</th>
<th>Main teaching</th>
<th>Notes</th>
<th>Plenary and homework</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Understand and use decimal notation and place value.</td>
<td>- Identify patterns in their findings and drawing on these to come to some conclusions that they can explain and justify.</td>
<td>- if any pupils have not previously done the Year 6 activity, introduce it and allow time for them to consider the problem; they may need support in tackling it systematically.</td>
<td>- Plenary Question pupils about what they have found, asking them to explain what they recorded, what conclusions they came to, and how.</td>
</tr>
<tr>
<td>- Understand negative numbers as positions on a number line; order and add positive and negative numbers.</td>
<td>- How did you pay for an item costing 39p? Is there more than one way of paying 39p?</td>
<td>- How did you know you had found all the possible values?</td>
<td></td>
</tr>
<tr>
<td>- Consolidate the rapid recall of number facts, including multiplication facts to 10 × 10, and quickly derive associated division facts.</td>
<td>- Were you able to make any value using 3p and 5p coins?</td>
<td>- How could you convince someone else that you had found all the possible values?</td>
<td></td>
</tr>
<tr>
<td>- Solve word problems and investigate in the context of number; compare and evaluate solutions</td>
<td>- What about 7p and 10p?</td>
<td>- Were there any values you couldn’t make? Can you explain why?</td>
<td></td>
</tr>
</tbody>
</table>

**Framework examples** pp 36, 40, 48, 88

### Counting on and back from different starting numbers in steps of different sizes including decimals

Establish that pupils are familiar with negative numbers and can continue patterns below 0, for example:
- counting back from 20 in steps of 3, 7, 11, ...
- counting on from –11 in steps of 5, 20, 13, ...
- counting back from 10 in steps of 0.2, 0.7, ...

using a counting stick or an empty number line.

**3p and 5p coins**

Remind pupils of the coin problems they were set in Year 6:

*Imagine the Government has decided to issue only 3p and 5p coins. Using only 3p and 5p coins, you can pay for goods of any price. TRUE or FALSE? What other sets of coins could the Government introduce? What about 7p and 10p?*

Discuss with pupils the way they approached the problems, reminding them that they could receive change. Pose questions for them to consider then answer in pairs:

- **How did you pay for an item costing 39p? Is there more than one way of paying 39p?**
- **Were you able to make any value using 3p and 5p coins?**
- **What about 7p and 10p coins?**

Model some possible solutions and approaches to the problems, establishing what were important steps in finding the answers and whether the pupils were able to produce convincing arguments.

Highlight some important things to think about when solving problems, for example:
- being systematic
- keeping a careful record of their findings as they go along

**Double-sided cards**

Extend the problem to considering double-sided cards with positive and negative integers. Use some large cards, some with 7 on one side and –2 on the other, and others with 5 on one side and –3 on the other. Demonstrate the different values you can make.

- e.g. using one of each card you can make:

  \[ 7 + (−3) = 4 \]

Confirm that, using one of each card, these values are possible:

12, 4, 3, –5

Ask pupils to work in pairs to establish how many different values they can find if they use two of each of the cards.
Lesson 2 Extending to negative values

<table>

<tr>
<td>▪ Understand negative numbers as positions on a number line; order negative numbers.</td>
<td>▪ Understand negative numbers as positions on a number line; order, add and subtract negative numbers.</td>
<td>In the oral and mental starter, numbers can be selected to make the task easier e.g. choose integers (positive and negative) to give an even difference, or numbers that are close together.</td>
<td>Discuss results and strategies, for example by asking pairs:</td>
</tr>
<tr>
<td>Framework examples pp 40, 48</td>
<td>▪ Solve word problems and investigate in the context of number; compare and evaluate solutions.</td>
<td>The main teaching activity can be simplified by using only positive values, by allowing the use of any number of cards or by using addition only.</td>
<td>▪ Is it possible to make –6?</td>
</tr>
<tr>
<td>Mid-points</td>
<td>Adding and subtracting positive and negative integers</td>
<td>Links to Springboard 7, Unit 2.</td>
<td>▪ How many different ways are there to make –6?</td>
</tr>
<tr>
<td>Draw an empty number line and write a number at each end. Put a mark or a cross half-way along the line and ask pupils what number will be at the mid-point. For example:</td>
<td>Using empty number lines (horizontal and vertical) or by extending number patterns (Framework examples page 48), model addition and subtraction of positive and negative integers.</td>
<td>How can you convince someone that this is true?</td>
<td></td>
</tr>
<tr>
<td>–6</td>
<td>4</td>
<td>Ask pupils if their strategies change when they are dealing with different types of number, or when the end numbers are close/far apart.</td>
<td></td>
</tr>
<tr>
<td>Discuss the methods they used, using the number line to model their thinking. Quickly model another two examples, e.g. the mid-point between:</td>
<td>Ensure that pupils can record their number statements consistently.</td>
<td>Summarise the results and, if possible, get a pupil to demonstrate a systematic way of recording them.</td>
<td></td>
</tr>
<tr>
<td>▪ –11 and 5</td>
<td>More double-sided cards</td>
<td>In the main teaching activity, pupils could be asked to consider whether values are impossible to find.</td>
<td></td>
</tr>
<tr>
<td>▪ –3.5 and –1</td>
<td>Extend the double-sided card problem to adding and subtracting integers to make different values.</td>
<td>Could they find integers that would produce all the values from –25 to 25? Would this mean that any value could be found?</td>
<td></td>
</tr>
<tr>
<td>Ask pupils if their strategies change when they are dealing with different types of number, or when the end numbers are close/far apart.</td>
<td>Using any number of double-sided cards, some with 7 on one side and –2 on the other and others with 5 on one side and –3 on the other, what values could you find?</td>
<td>How could they justify their answer?</td>
<td></td>
</tr>
<tr>
<td>Ask pairs of pupils to practise finding mid-points, using a set of number cards (Resource sheet 1). Pupils each choose a card and then they find the number halfway between the numbers they have chosen, using an empty number line if they wish.</td>
<td>Can you find every value from –5 to 5?</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Support</td>
<td>Can you find every value from –5 to 5?</td>
<td>Discuss responses, acknowledging different ways of obtaining the same value.</td>
<td>Fill in the missing numbers so that each row, each column and each diagonal adds up to 3.</td>

## Lesson 4 Solving calculation problems

### Oral and mental

**Objectives**
- Enter numbers in a calculator and interpret the display in different contexts (decimals, money, metric measures).
- **Solve word problems and investigate** in the context of number; compare and evaluate solutions.  
  *Framework examples pp 2, 108*

### Main teaching

**Objectives**
- Understand and use decimal notation and place value; multiply and divide integers and decimals by 10, 100, 1000, and explain the effect.
- Enter numbers in a calculator and interpret the display in different contexts (decimals, money, metric measures).
- **Solve word problems and investigate** in the context of number; compare and evaluate solutions.  
  *Framework examples pp 2, 6, 108*

**More problem solving**

**Review the problem set for homework:**
- **A teacher needs 220 booklets. The booklets are sold in packs of 16. How many packs must the teacher order?**

**Ask two or three pupils to explain:**
- how they tackled the problem
- what calculation they did
- how they did the calculation (mentally? formal written calculation? using a calculator?)
- how they interpreted the answer on the calculator screen.

**Ask pupils to work in pairs on the word problems on Resource sheet 4 Problems in the millions!**

### Notes

Ask pupils to read through each problem, in pairs, estimate the answer and think about how they might solve it. Encourage pupils to jot down their methods of tackling the problem.

After about 5 minutes, check on progress and discuss the approaches pupils are adopting. If possible, draw on pupils’ own strategies, highlighting effective approaches to tackling the problems.

Give pupils time to work on some more examples, encouraging them to make sensible use of calculators and to take care in interpreting the calculator display.

### Plenary and homework

**Plenary**
- Collect answers and discuss pupils’ approaches, using the OHP calculator to illustrate methods.
- Round off the lesson by setting two number puzzles for pupils to solve, using a calculator. Ask pupils first to estimate each missing number, then use a calculator to work it out.

| **× 24.3 = 400.95** |
| **24 × 16.5 ÷ = 79.2** |

**Support**
- Links to *Springboard 7, Unit 2 (section 6)*, calculating with money.

**Extension**
- Select more demanding problems from *Framework examples pp 3, 7, 109.*

**Homework**
- Ask pupils to make up a similar number puzzle for someone in their class to solve.

**Objectives**

• Understand and use decimal notation and place value; multiply and divide integers and decimals by 10, 100, 1000, and explain the effect.
• Enter numbers in a calculator and interpret the display in different contexts (decimals, money, metric measures).
• Solve word problems and investigate in the context of number; compare and evaluate solutions.

**Framework examples** pp 6, 36

**Largest calculation**

Give pairs of pupils one minute to discuss the following problem and to decide how they would tackle it.

- **Using each of the digits 1, 2, 3, 4, 5 only once, what is the largest addition calculation you can make?**

Set the following examples.

- □□□ + □□□ = 69
- 105 – □□□ = □□□
- □□□ + □□□ = 99

Ask feedback and establish that they would use what they know about place value and addition to make a decision. Which digit would they place first? Which one next? …

Acknowledged that addition is relatively easy. What if they used a different operation, while still looking for the highest result? For subtraction, for example, would they approach the problem in the same way? What about multiplication and division?

Give out Resource sheet 5 Largest calculations for pupils to work on, in pairs. Ask them to think carefully about how they will tackle the problem and how they can draw on what they already know about numbers and number operations.

**Support**

Simplify questions in the oral and mental starter by, for example, giving some of the digits or providing number cards to support the activity. Links to Springboard 7, Unit 2 (sections 2, 4, 5) and Unit 10 (section 2).

**Take feedback on answers, the ways pupils have thought about the problem and the prior knowledge and understanding that they have used.**

Ask how the problem could be extended. For example:

**What if …**
- you could use any five digits from 1 to 9
- you could group the digits in different ways e.g.
  - □□□□□ × □
  - □□□□□ × □ □
- you could use a decimal point
- you were trying to find the smallest result?

Ask each pair to decide upon the question they will pursue and give them 5 minutes to get started. Bring the class together to share their thinking so far and to establish their lines of investigation.

**Plenary**

To emphasise the importance of place value, play this game.

**Support**

Roll a dice, call out the number (say, 3) and give each team 10 seconds to decide what they think is the most advantageous position for the digit represented by the number on the dice. Both teams place their digit and play continues until each team has placed all five digits. The team with the larger product wins.

Ask pairs to play the same game, using Resource sheet 6 Largest product.

**Homework**

Ask pupils to play this game with someone at home.

1 What is the smallest number you can subtract from a million to make the answer exactly divisible by 7893? What is the smallest number you can add to a million to make the answer exactly divisible by 9821?

2 How long in days, hours, minutes and seconds is one million seconds? Are you a million seconds old? How old are you in seconds?

3 Sharman is trying to get as close as she can to a million. She can use each of the digits 1 to 9, once and once only, any of the operations +, −, × and ÷, and brackets.

She has tried two examples and has started recording her answers and how far they are from a million.

<table>
<thead>
<tr>

</table>

How close can you get to one million?

4 Seven sisters were left £1 million by a rich aunt. How much will each of them receive?
Using the digits 1, 2, 3, 4 and 5 what is the largest result you can find for each calculation?

\[
\begin{align*}
\text{□ □ □} & \quad + \quad \text{□ □ □} \\
\text{□ □ □} & \quad - \quad \text{□ □ □} \\
\text{□ □ □} & \quad \times \quad \text{□ □ □} \\
\text{□ □ □} & \quad \div \quad \text{□ □ □}
\end{align*}
\]
Rules
The aim of the game is to make the largest product. Each player takes it in turn to roll a dice and decide which position to place the number in their calculation. After each player completes their calculation, the player with the largest product wins.

My calculation

Multiply 673 by 6, 15, 34 or 87

I did this calculation:
on my own
with some help

Show or discuss with a friend.

Multiply 5.34 by 4, 7 or 9

I did this calculation:
on my own
with some help

Show or discuss with a friend.

Divide 936 by 8, 13, 24 or 39

I did this calculation:
on my own
with some help

Show or discuss with a friend.

Divide 259.56 by 4, 6 or 9

I did this calculation:
on my own
with some help

Show or discuss with a friend.
The booklet problem
A teacher needs 275 booklets. The booklets are sold in packs of 15 and each pack costs £3.75. How much will the booklets cost altogether?

Clare says:
I divided £3.75 by 15 in my head and worked out that each booklet costs 25p. I multiplied 25 by 275 to get the total cost as £68.75.

I think Clare is right/wrong because:

Show or discuss with a friend.
